1973

PREFACE

In 1968, the U.S. Congress directed the Secretary of Commerce to undertake the U.S. Metric Study to evaluate the impact on America of the metric trend and to consider alternatives for national policy. The conclusion of this study was that the United States should change to the metric system. A coordinated 10-year national program for conversion by a target date set by the U.S. Congress was recommended.

In line with this program, previously published pressure-airspeed tables have been revised to the atmospheric properties of the U.S. Standard Atmosphere of 1962 and the results were converted to the International System of Units. Atmospheric properties such as temperature, density, and speed of sound are also listed.

INTRODUCTION

Because inception of a national program to implement the International System of Units (SI) appears to be inevitable and imminent, the tables of airspeed, altitude, and Mach number prepared by Livingston and Gracey (ref. 1) to serve for airspeed meter and altimeter calibrations and for the conversion of flight measurements of these quantities to related parameters – Mach number, true airspeed, equivalent airspeed, etc. – have been revised to the International System of Units (SI). Tables of airspeed in knots are also included because of the significance of this quantity in navigation. In addition, the data in the altitude tables have been revised to the U.S. Standard Atmosphere of 1962. (See ref. 2.) The latter data reflect increased knowledge of the higher atmosphere and more precise determination of basic quantities, including the redefinition of the absolute thermodynamic temperature scale by the Tenth General Conference on Weights and Measures in 1954. The U.S. Standard Atmosphere, 1962, corresponds to the International Civil Aviation Organization (ICAO) Standard Atmosphere up to 20 kilometers (geopotential altitude). A table of conversion factors for various pressure units is presented in SI Units.

SYMBOLS

a	speed of sound in ambient air
g	acceleration of gravity
H	geopotential altitude
L'_M	gradient of T_M with H
M	free-stream Mach number; molecular weight in definition of W
M_l	local Mach number
p	free-stream static pressure
q_c	impact pressure
R	universal gas constant
T	temperature

T_M	molecular scale temperature (as defined in ref. 2)
T_m	measured temperature
V	true airspeed
V_c	calibrated airspeed
W	mean molecular weight of air (denoted by symbol M in ref. 2)
Z	geometric altitude
γ	specific heat ratio
ρ	density of air
η	recovery factor of air-temperature sensor

Subscripts:

b	base or reference level
o	sea-level value

DISCUSSION OF SI SYSTEM

The SI system is constructed from seven base units for independent quantities plus two units for plane and solid angle. The SI units for plane and solid angle are the radian (rad) and the steradian (sr), respectively. Units expressed as combinations of these units are called derived units. (The tables in this section are from ref. 3.) The seven base units are

Physical quantity	Name of unit	Symbol
Length	meter	m
Mass	kilogram	kg
Time	second	s
Electric current	ampere	A
Thermodynamic temperature	kelvin	K
Luminous intensity	candela	cd
Amount of substance	mole	mol

Special names and symbols for pertinent SI derived units are

Physical quantity	Name of SI unit	Symbol for SI unit	Definition of SI unit
Force	newton	N	$\text{kg}\cdot\text{m}\cdot\text{s}^{-2}$
Pressure	pascal	Pa	$\text{N}\cdot\text{m}^{-2}$

Although not an SI unit, a bar, a commonly used unit of pressure, is a multiple of an SI unit:

$$1 \text{ bar} = 10^5 \text{ N}\cdot\text{m}^{-2} = 10^5 \text{ pascals}$$

Prefixes used for multiples and submultiples of SI units are

Factor by which unit is multiplied	Prefix	Symbol
10^{12}	tera	T
10^9	giga	G
10^6	mega	M
10^3	kilo	k
10^2	hecto	h
10	deka	da
10^{-1}	deci	d
10^{-2}	centi	c
10^{-3}	milli	m
10^{-6}	micro	μ
10^{-9}	nano	n
10^{-12}	pico	p
10^{-15}	femto	f
10^{-18}	atto	a

PHYSICAL CONSTANTS AND SEA-LEVEL ATMOSPHERIC PROPERTIES

The values of the physical constants and sea-level atmospheric properties used for the computation of the tables given in this paper are as follows:

$p_0 = 760.0$ millimeters of mercury or $101\ 325.0$ pascals (newtons per square meter)

$\rho_0 = 1.2250$ ~~kilograms~~ per cubic meter

$$T_0 = 288.15 \text{ K}$$

$$W_0 = 28.9644 \text{ (dimensionless)}$$

$$\gamma = 1.40 \text{ (dimensionless)}$$

$$a_0 = 1225.057 \text{ kilometers per hour or } 661.041 \text{ knots}$$

These values were taken from reference 2.

In this paper, the values of airspeed are given for pressures expressed in units of millimeters of mercury, millibars, and pascals (newtons per square meter). Conversion factors for expressing the tabulated pressures in other units (based on data from refs. 2 and 4) are given in table I.

AIRSPED TABLES

Aircraft airspeed indicators are calibrated according to the following equations for standard sea-level conditions:

$$q_c = p_0 \left[\left(1 + \frac{\gamma - 1}{2\gamma} \frac{p_0}{V_c^2} \right)^{\frac{\gamma}{\gamma-1}} - 1 \right] \quad (V_c \leq a_0) \quad (1)$$

and

$$q_c = \frac{1 + \gamma}{2} \left(\frac{V_c}{a_0} \right)^2 p_0 \left[\frac{(\gamma + 1)^2}{4\gamma - 2(\gamma - 1) \left(\frac{a_0}{V_c} \right)^2} \right]^{\frac{1}{\gamma-1}} - p_0 \quad (V_c \geq a_0) \quad (2)$$

where the subscript o denotes standard sea-level conditions, V_c is the calibrated airspeed, and q_c is the impact pressure. For standard sea-level conditions, calibrated airspeed is equal to true airspeed. The derivations of equations (1) and (2) are found in reference 1.

Values of impact pressure q_c calculated from equations (1) and (2), in units of millimeters of mercury, newtons per square meter, and millibars are given in tables II to VII for calibrated airspeed V_c from 0 to 1000 knots and from 0 to 1700 kilometers per hour. For the tables with V_c in knots, the nautical mile is defined as 1852 meters.

The reader is reminded that determination of V_c for supersonic speeds from the tabulated data, or by use of equation (2), requires that the measurement of q_c be made in the free stream ahead of any shock waves created by the vehicle.

ALTITUDE TABLES

Within an atmospheric layer throughout which the molecular scale temperature is a linear function of geopotential altitude, the hydrostatic equation and the perfect gas law yield the following expressions for pressure:

$$\log_e p = \log_e p_b - \frac{g_o W_o}{L'_M R} \log_e \frac{L'_M (H - H_b) + T_{M,b}}{T'_{M,b}} \quad (L'_M \neq 0) \quad (3a)$$

$$\log_e p = \log_e p_b - \frac{g_o W_o}{R} \frac{1}{T_{M,b}} (H - H_b) \quad (L'_M = 0) \quad (3b)$$

where L'_M is the gradient of molecular-scale temperature with geopotential altitude. The quantity H_b is the geopotential altitude at the base of a particular layer characterized by a specific value of L'_M ; $T_{M,b}$ is the temperature value at altitude H_b ; and

$$T_M = \frac{W_o}{W} T$$

and

$$H = \int_0^Z \frac{g}{g_o} dz$$

Thus, equations (3a) and (3b) take into account the decrease in acceleration of gravity with height and the decrease in the molecular weight of air with height. Equations (3a) and (3b) were developed in reference 2, which includes tables of pressure-altitude values based on these equations.

In the pressure-altitude tables of the present paper, the altitudes are given in geopotential meters. Tables VIII to X give values of static pressure p in millimeters of mercury, pascals (newtons per square meter), and millibars, respectively, for values of pressure altitude up to 30 000 geopotential meters. The values of p in tables VIII and X were taken directly from reference 2. The values of p in table IX were calculated from the values in table VIII by use of the conversion value from table I.

MACH NUMBER TABLES

Mach number can be expressed as a function of both static and impact pressure by the following equations:

$$\frac{q_c}{p} = \left(1 + \frac{\gamma - 1}{2} M^2\right)^{\frac{\gamma}{\gamma-1}} - 1 \quad (M \leq 1) \quad (4)$$

and

$$\frac{q_c}{p} = \frac{1 + \gamma}{2} M^2 \left[\frac{(1 + \gamma)^2 M^2}{4\gamma M^2 - 2(\gamma - 1)} \right]^{\frac{1}{\gamma-1}} - 1 \quad (M \geq 1) \quad (5)$$

A derivation of these equations may be found in reference 1. Table XI gives the values of the ratio of impact pressure to static pressure, q_c/p , calculated by equations (4) and (5), for values of Mach number from 0.10 to 5.00.

The reader is reminded that the determination of Mach number at supersonic speeds from the tabulated data or by use of equation (5) requires that the measurements of q_c and p be made in the free stream ahead of any possible shock waves created by the vehicle.

TRUE AIRSPEED TABLES

True airspeed can be calculated from

$$V = Ma \quad (6)$$

Since the speed of sound is a function of the absolute temperature of the ambient air in accordance with the equation

$$a = \sqrt{\gamma \frac{p_0}{\rho_0} \frac{T}{T_0}} \quad (7)$$

true airspeed can be determined from measurements of (1) Mach number, which can be measured directly or computed from measurements of calibrated airspeed and geopotential altitude, and (2) free air temperature. From the measurements of free air temperature, the speed of sound can be calculated from:

$$a = 38.9679 \sqrt{T} \quad (8)$$

where T is in kelvins and a is in knots or

$$a = 72.1685 \sqrt{T} \quad (9)$$

where T is in kelvins and a is in kilometers per hour.

Values of speed of sound in kilometers per hour and knots, calculated from these equations, but expressed for convenience in $^{\circ}\text{F}$ and $^{\circ}\text{C}$, are listed in tables XII and XIII, respectively.

Table XIV presents temperature in $^{\circ}\text{F}$ and $^{\circ}\text{C}$, speed of sound in kilometers per hour and knots, and density in kilograms per cubic meter for values of pressure altitude in geopotential meters. The values of density and $^{\circ}\text{C}$ are from reference 2. The others are calculated values.

It should be noted that the value of T required for the calculation of V is the temperature of the free stream. For the usual case, the temperature measured by an aircraft thermometer is greater than the free-stream value because of the adiabatic heating effect of the air flow on the temperature sensor. If the sensor measures the full adiabatic temperature increase (if the recovery factor of the sensor is 1.0) or if the sensor is located in a region where the local velocity of the air is equal to the free-stream velocity, the free air temperature can be calculated by

$$T = \frac{T_m}{1 + \frac{\gamma - 1}{2} \eta M^2} \quad (10)$$

where T_m is the measured temperature and η is the recovery factor of the temperature sensor. For the more general case in which η is less than 1.0 and the sensor is located in a region where the local velocity differs from the free-stream value, the free-stream temperature can be computed by

$$T = \frac{T_m}{1 + \frac{\gamma - 1}{2} \eta M_l^2} \frac{1 + \frac{\gamma - 1}{2} M_l^2}{1 + \frac{\gamma - 1}{2} M^2} \quad (11)$$

where M_l is the local Mach number, which can be determined from measurements of the local static pressure in the region in which the temperature sensor is located (ref. 1).

CONCLUDING REMARKS

Previously published pressure-airspeed tables have been revised to the atmospheric properties of the U.S. Standard Atmosphere of 1962, and the results were converted to the International System of Units. In the present tables, values of impact pressure are given for airspeeds up to 1000 knots and 1700 kilometers per hour. Pressure-altitude tables are given for altitudes up to 30 000 geopotential meters. For the determination of Mach number, tables of the ratio of impact pressure to free-stream static pressure are given

for Mach numbers from 0.10 to 5.00. Atmospheric properties, such as temperature, density, and speed of sound, are given for altitudes from -1000 to 30 000 geopotential meters.
